## Promises

↳ (vada).

## Promises In JS [4 stages of promises]

(on the basis of promises, we study Async Await).

Promise also shows Async Behaviour.

⇒ (then & catch is similar to try & catch)

Promise / fulfill (then) [when we want our promise to be fulfilled].  
                  ↓  
                  Rejection (catch).

- JS treats promises as object.

In JS,      Array - object  
                  function - object  
                  object - object  
                  promise - object.

Call stack  
Event loop  
Queues  
Node API

~~How to construct a Promise?~~

For Every Promise we have dedicated methods, either to fulfill or to Reject.

Promise → fulfill      dedicated methods  
                                  (then)  
                                  ↓  
                                  (catch)

(It is similar to try & catch).

"ॐ श्रीगणेशाय नमः"

Date .....

Note:- In callbacks, when we did our "dry run",

we used Queue(callback)

In promise, while doing "dry run", we'll use  
microtask Queue

[microtask Queue has higher priority than callback Queue].

Note :- (JS, treats promise as object)

# How to construct a promise?

Syntax :-

let myPromise = new Promise(callback fn. also a function.  
(function(resolve, reject)))  
{  
}

resolve  
→ .then

reject  
→ .catch
